Appendix A:

Atlas of Infrared Spectral Ranges

The *Atlas of Infrared Spectral Ranges* summarizes the wavelength range over which spectra have been published for individual sources since plotted spectra cannot be easily included in the current automated data base. It lists the source name, starting and ending wavelengths (in microns), and bibliographic reference number for each published infrared source spectrum. Only the starting wavelength is given in the main Catalog. This Atlas is sorted alphabetically by object name. The bibliographic reference number refers to the original article listing in Appendix C.

Although the Goddard Infrared Astronomical Data Base nominally covers a wavelength range of $1\ \mu\text{m}$ – $1\ \text{mm}$, some observations at wavelengths outside this range have been included. For example, wavelengths less than $1\ \mu\text{m}$ appearing in this Atlas indicate that the spectra start at those wavelengths and extend into the infrared.

Appendix B:

Bibliography of Infrared Astronomy

(Alphabetical Order)

The *Bibliography of Infrared Astronomy* links observations in the Catalog with the original articles published in the astronomical literature. Approximately 4100 journal articles and other references are listed in this Appendix. The Bibliography is arranged alphabetically by first author in this Appendix (and chronologically by reference number in Appendix C). It contains the authors' names, journal name or document number, volume, page, and full title.

The bibliographic reference number is made up of the year and month of publication, and a sequential number assigned to the article (for example "790104" is broken down into 79-01-04, where 79 = 1979, 01 = January, and 04 = article #4 in that month).

References used in the data base, but not containing infrared information, have an "89" or "99" as the month of publication. An "89" means that the reference was published in the 1800s. References which do not indicate the month of publication have "00" in the month field.
